

Cable tray T-junction bridge

Article Overview

A cable tray T-junction bridge allows smooth, organized routing of cables at T-shaped intersections, preventing kinks and maintaining signal integrity.

Purpose and Function

A T-junction bridge is used in cable management systems to connect multiple cable tray sections at a T-shaped intersection. Its primary function is to keep cables separated and organized, ensuring that network or power cables do not kink, bunch, or interfere with each other, which is critical for maintaining signal integrity and reducing wear on cables. These bridges are particularly useful in data centers, industrial facilities, and telecommunications installations.

Design Features

- **Smooth Cable Transition:** The bridge design provides a gentle curve for cables, minimizing stress and preventing sharp bends.
- **Predrilled Mounting Holes:** Many models, such as the Cablofil HTB300EZ, come with predrilled holes and slots to secure cables with nylon zip ties.
- **Compatibility:** Bridges can be mounted using specific clips (e.g., BC1 Bridge Clip) and are compatible with junction hardware like CE35 or EZT90/RADT90.
- **Bend Radius:** Some T-trays, like the ASP T Transition Cable Tray, offer a 24-inch bend radius to facilitate coaxial cable installation.

Installation
