

Directional Optical Splitter

Overview

A coupler can be used as a splitter to couple out some portion of the light circulating in the resonator of fiber laser, for example. Directional 2×2 couplers (see Figure 1) are usually used for such purposes. The same kind of device is useful in fiber interferometers, also. An optical splitter is a crucial passive fiber optic device that splits and combines optical signals. It is. Thorlabs offers a varied selection of single mode (SM), polarization-maintaining (PM), multimode (MM), and double-clad fiber couplers, as well as 1x8 and 1x16 SM PLC splitters; 1x4, 1x8, and 1x16 PM PLC splitters; wideband multimode circulators; RGB combiners; and WDMs. They couple a defined amount of the electromagnetic power in a transmission line to a port enabling the signal to be used in. These unassuming devices enable a single optical signal to be divided into multiple paths, making them indispensable for sharing network resources efficiently—from residential FTTH (Fiber-to-the-Home) connections to large-scale telecom backbones. 2dB excess loss, while splitters distribute evenly (50:50) but introduce 3dB loss per output.
