

Electrical distribution box cables

Article Overview

Electrical distribution box cables are the incoming and outgoing wires that carry power into the distribution box and distribute it safely to multiple branch circuits.

Overview

A distribution box (also called a DB box, breaker panel, or distribution board) is a central hub in an electrical system that receives power from the main supply and distributes it to various circuits within a building . The cables connected to a distribution box are essential for safely transmitting electricity to and from the box.

Types of Cables in a Distribution Box

- Incoming Power Cables
 - These cables bring electrical power from the main supply, such as a utility transformer, main switchboard, or another distribution board .
 - They are typically thicker and rated for higher current, as they carry the total load of all outgoing circuits.
 - Materials often include copper or aluminum conductors with insulation suitable for the voltage and environment.
- Outgoing Branch Cables
 - These cables carry power from the distribution box to individual circuits, such as lighting, sockets, machinery, or HVAC systems .
 - Each outgoing cable is connected to a circuit breaker or fuse, which protects the circuit from overloads or short circuits.
