

Home Network Security Devices

Article Overview

Home network security devices, such as dedicated firewalls and secure routers, protect all connected devices from cyber threats while offering advanced management and monitoring features.

Hardware Firewalls

Hardware firewalls are standalone devices that sit between your internet connection and your home network, providing an extra layer of protection beyond standard router firewalls. They monitor incoming and outgoing traffic, block malicious activity, and can protect devices that lack built-in security, such as smart home gadgets, video doorbells, and baby monitors . Popular options include:

- Ubiquiti Unifi Security Gateway (USG): Offers VLAN support, deep packet inspection, intrusion detection, and integration with other Unifi devices. It provides remote management through the Unifi Controller GUI and supports high-speed Gigabit Ethernet .
- TP-Link ER605 V2: A budget-friendly option with enterprise-grade features like Stateful Packet Inspection (SPI), DoS defense, URL filtering, and multi-WAN failover for uninterrupted connectivity .
- Bitdefender BOX 2: Combines firewall protection with cloud-based security for all devices, including smart home integration with Google Assistant and Amazon Alexa. It also offers antivirus and antimalware services .
