

Long-distance optical cable energy-saving type for Laos power system

Overview

Fiber optic cables are more energy-efficient than copper cables because they require less power to transmit data over long distances. o low-carbonization, and hydropower accounts for most of the country's power supply. In order to make effective use of these resources. The power transmission system of Lao PDR is divided into two types of transmission lines – one for domestic supply and one for export, where power plants are directly connected to neighbouring countries. Each is not connected to the other within the borders of Lao PDR. As with most new technologies, the engineering challenges associated with its assimilation into the. Lao PDR is a country with abundant natural resources, particularly water resources that provide an excellent basis for the energy sector to generate hydro power. The government has set 03 targets of electrification 95% in 2020, 98% in 2025, and 100% in 2030. 05 cover 15% of the. Electric du Laos and Best Telecom Company Limited have signed a partnership agreement on the use of fibre optic lines in the national power grid, helping transform Laos from a digital land-lock country into a digital land-link.
