

Mobile Fiber Distribution Box Morocco

Article Overview

Morocco is rapidly expanding its fiber-optic and mobile network infrastructure through Uni Fiber and Uni Tower, enabling widespread FTTH and 5G deployment.

Overview of Fiber Distribution

Morocco's telecom operators, Maroc Telecom and Inwi, have established two joint ventures—Uni Fiber and Uni Tower—to accelerate the rollout of fiber-to-the-home (FTTH) and mobile network infrastructure. Uni Fiber is responsible for deploying the passive fiber infrastructure, which includes fiber distribution boxes, optical splitters, and access points that connect directly to homes and businesses. The goal is to reach one million fiber connections within two years and three million within five years. This infrastructure ensures high-speed internet access and supports the growing demand for digital services.

Mobile Fiber Distribution Boxes

Mobile fiber distribution boxes, also known as fiber distribution hubs or cabinets, are key components in the network. They serve as intermediate points where the main fiber backbone is split and distributed to multiple subscribers. These boxes are typically installed in neighborhoods, near telecom towers, or along streets, and they facilitate efficient FTTH deployment by connecting multiple homes or businesses to a single fiber line. In Morocco, these boxes are part of the open-access network, meaning all licensed operators can use the infrastructure under transparent and non-discriminatory conditions.
