

PLC junction box

Article Overview

To connect a PLC to a junction box, you need to wire the field devices to the junction box and then route the signals to the PLC through a main cable.

Steps to Connect PLC to Junction Box

- **Field Device Wiring:**
 - Connect your field devices (like sensors or transmitters) to the junction box using branch cables. Each device typically requires a pair of wires (positive and negative) for signal transmission. For example, if you have five devices, you would use five separate branch cables to connect them to the junction box .
- **Main Cable Connection:**
 - From the junction box, use a main cable (also known as a home run cable) to connect to the PLC. This cable consolidates the signals from multiple field devices into a single cable, which simplifies the wiring process. It is common to use a multi-pair cable (e.g., 6-pair or 12-pair) to accommodate future expansions or additional devices .
- **Marshalling Cabinet:**
 - In many setups, the main cable from the junction box is routed to a marshalling cabinet. This cabinet organizes and terminates the incoming cables, allowing for easier management and re-distribution of signals to the PLC's input/output (I/O) cards. The internal wiring from the marshalling cabinet connects to the PLC system cabinet .
