

Packet loss across network segments at core switch

Overview

Use the following commands (based on switch OS): 2. Verify Port Configuration
Ensure both sides of a link have the same speed/duplex settings. Packet loss occurs when data packets transmitted through a network fail to reach their destination. Imagine ordering a desk that ships in five boxes. Boxes 1, 2, 4, and 5 arrive undamaged, but box 3—containing every last screw, bolt, and connector, of course—has gone missing in logistics-land. The initial symptoms pointed towards a classic network bottleneck, but the root cause turned out to be a less obvious configuration. This document describes a detailed methodology for troubleshooting network latency and packet loss issues on Cisco Catalyst 9000 Series switches. Cisco recommends that you have a fundamental understanding of networking concepts, including TCP/IP, VLANs, and Spanning Tree Protocols (STPs). The high latency, jitter, and loss. Our room controllers operate on a loop topology just daisy chaining one device to another to another etc, until it reaches EOL, and then the last device loops back to the floor switch creating a loop that is protected by the RSTP.
