

The red light on the outdoor distribution box is no longer flashing

Overview

A red light means the GFCI has detected a problem, such as: If RESET doesn't clear it, stop using outlet and call an electrician. No Light - Possible Issue No Light may mean: Try pressing RESET. If the outlet still doesn't work, it needs professional attention. The LED on a GFCI is its "status indicator." Depending on the model, it may show green, white, red (solid or blinking), or no light at all. In some instances, such as the Smart GFCI, the indicator light will flash green when it is in set up mode or feature an amber colored slow blink when it lost. The light is a visual cue that power protection has been compromised or activated, depending on the type of electrical device installed. Before interpreting the light, determine which. The lights are coded in such a way that they can have a steady, flickering, or blinking glow, and are normally color-coded in two or more colors, including green, red, orange, or yellow, to provide you with a more accurate diagnosis. GFCI outlets are one of the most important safety features in your home, and understanding what they do and why they sometimes fail can save you from a much bigger headache down the road. This is one type of electrical outlet commonly found in every home since the 1970s.
