

What is the maximum uplink bandwidth that an optical module can achieve

Overview

100G uplinks are used for large OLT devices (16 ports or more). It is recommended that uplink bandwidth should not be less than 50% of the total peak user bandwidth. Small Form-factor Pluggable (SFP) is a compact, hot-pluggable network interface module format used for both telecommunication and data communications applications. These modules, including SFP, SFP+, and SFP28, are widely used in enterprise networks, data centers, and carrier-grade deployments. SFP+ is the most common OLT uplink port type, offering 10Gbps bandwidth. SFP+ OLT modules support transmission distances up to 10km, suitable for most metro network deployments. QSFP+ ports provide 40Gbps bandwidth, suitable for medium to large OLT. As module bandwidth increases, the ever-growing need for faster data rates drives transceivers towards miniaturization, high speed, and low power consumption to accommodate higher integration and denser connectivity requirements. However, 400G remains more cost-effective for. Quick answer: fiber optic networks commonly run at 1G, 10G, 25G, 40G, 100G, 200G, 400G and 800G, while carrier and backbone systems can scale much higher with WDM.
