

Which layer does the core switch belong to

Overview

A core switch is a high-capacity, high-performance Layer 3 switch positioned at the physical backbone of an enterprise network. Engineered to aggregate massive volumes of data from distribution switches, it provides ultra-low latency and maximum throughput to ensure uninterrupted routing and packet. Which layer is the core switch?

The core switch is the physical core layer. It can be considered a central network layer that performs all the functions, like monitoring traffic and empowering the whole system. In these switches, the data routed and switched. What is Spanning Tree Protocol (STP) and why is it important in core switch networks?

What Is a Core Switch in Networking?

Understanding the Backbone of Your Network A core switch in networking. The layer that lies between the access layer and the core layer is known as the distribution or aggregation layer, while the backbone of the network is termed the core layer.
